

How many reindeers will need to be used to pull a sleigh.

On land conventional reindeers can not pull anything more than 136 kilograms. The slay will way a lot more that the 9 reindeers santa actually has including the presents he has to carry. There is an estimated 2 billion children in the world and only 15% celebrate it. Meaning that there will be 300 million children to give presents to. This could be decreased again by the behaviour of the children. If 1 in 3 children are badly behaved then only 200 million children will be getting presents. If every child's present weighed 2 kilograms then the sleigh will have to carry 400 million kilograms of presents. The sleigh itself will weigh at least 400 kilograms. Also adding on Santa's weight which will be about 150 kilograms. All adding up to 400,000,550 kilograms. So 400,000,550 Kg divided by the amount one reindeer can pull equals 2,941,180 reindeers.
