How do you teach pupils to solve those 'end-of-paper' GCSE questions on vectors?

Hosted by Dani Quinn @danicquinn
ncetm.org.uk/mathscpdchat

Some of the areas where discussion focussed were:

- the **point/stage/time in pupils' mathematical learning journeys when they first encounter the idea of a vector** ... 'during Year 11' ... 'alongside translations' ... 'for plotting routes' ... 'in Year 8 in the context of journeys (on maps drawn on square grids)' ... 'as column vectors, followed by translations and enlargements described using column vectors' ... 'when learning about translations or gradients in Key Stage 3' ... 'it's the first topic of Year 11' ... 'we find out where science introduce the idea (with forces or with velocity) and do it just before';

- that vectors might be more easily understood if they were introduced in **the context of transformations** (other than enlargement) **of single points** rather than of shapes;
- that **one of the most important ideas** that students need to grasp is that **vectors represented by parallel line-segments of equal length (magnitude) are identical** ... understanding that (partly) concurrent line-segments are parallel ... that the ability to visualise parallel vectors is important when reasoning from given information and diagrams;
- the crucial understanding that on coordinate grids **column vectors name movements, whereas coordinates name points**;
- 'laying the groundwork for those end-of-paper GCSE vector questions' by factorising algebraic expressions, thus focussing on multiples, for example seeing $20x + 30y$ as $10(2x + 3y)$... using fractional and negative factors, as in $(x/2) - (y/4) = -(1/4)(y - 2x)$;
- **moving from column vectors to 'generalised' vectors** ... for example 'if \vec{OA} takes $(1, 0)$ to $(6, 9)$, and \vec{OA} is \mathbf{a} , to where does $-\mathbf{a}$ take $(0, 0)$?' ... that it helps to introduce ('general') vector notation sooner rather than later ... that it is a 'large leap' from using column vectors to working with 'abstract' vectors using letter notation;
- whether it might be helpful to introduce vectors **when the focus is on fractions and ratio** ... for example, ' \vec{OA} is vector \mathbf{a} , P is a point on OA such that $OP : OA$ is $2 : 3$, express \vec{OP} in terms of \mathbf{a} ';
- finding or creating **material likely to build students' confidence and 'root-out confusion'**;
- **designing simple vector tasks/items involving ratios**, before moving on to using vectors to solve problems ... for example using this kind of variation: 'express \vec{OP} in terms of \mathbf{a} if \vec{OA} is \mathbf{a} , and P is a point on OA such that $OP : PA$ is: $1 : 1, 1 : 2, 1 : 3, 2 : 3, \dots$ ';
- that **introducing vectors when describing enlargements with fractional and negative scale-factors** may 'prepare the way' for seeing the sense in writing fractional and negative multiples of 'general' vectors;
- that **students who are 'put off' by the topic of 'Vectors'** need 'lots of exposure to vectors over time' ... 'underestimating the power of slowly weaving-in vector ideas, building confidence gradually' ... using 'goal-free' vector problems to help students overcome their fear of them;
- the value of both teachers and students **expressing their reasoning in detailed step-by-step written explanations**;

- that students **annotating vector diagrams** helps them reason to conclusions/solutions ... that it can sometimes be helpful to reproduce a vector diagram several times, each time with different annotations corresponding to different steps of reasoning;
- teachers who were contributing to the discussion being able to describe what they did in order to solve a 'vector problem', but **being unable to explain how they knew what to do**;
- **various different methods used by teachers contributing to the discussion** to solve relatively complex vector problems ... that an obstacle to students being able to equate coefficients and solve the resulting equation as successive steps in a solution is their inability to form and solve equations in any situation ... the strategy of equating ratios of coefficients, rather than equating coefficients;
- not under-valuing **the role of geometrical reasoning in solving 'those end-of-paper GCSE vector problems'** ... that using a geometrical method of solution may avoid the need to equate coefficients and solve the resulting equation;
- challenging students to **create their own 'vector patterns'** as a way to get them thinking and talking about what happens when vectors are combined.

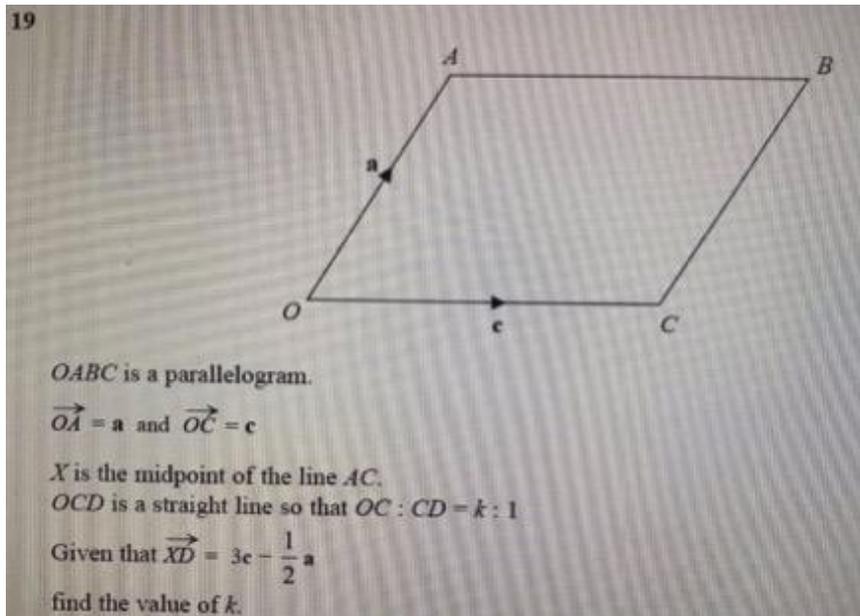

In what follows, click on any screenshot-of-a-tweet to go to that actual tweet on Twitter.

This is part of a 'conversation' of tweets about various different ways, adopted by contributors to the discussion, of approaching the task of solving a particular vector problem that the host presented. The conversation was generated by this tweet from [Dani Quinn](#):

Dani Quinn 🖋️ @danicquinn · Nov 19

Q2: [#mathscpdchat](#) How would you tackle this? Share your working! Or 'do it live' and tweet your reasoning. I suspect there are many approaches, it would be wonderful to narrow down to a few ways that always work. This is from June 2017, Edexcel

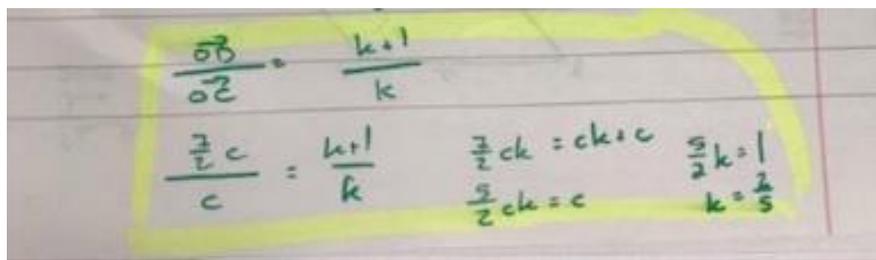

and included these from [Dani Quinn](#), [David Chart](#) and [Catherine van Saarloos](#):

Dani Quinn @danicquinn · Nov 19

Replying to @danicquinn

Here is my quite confused working...turned out the bits in yellow were all I needed 😊 And no idea why I initially got $-3/5$ 😞😞😞 Different approach to equating coefficients: setting up a fraction #mathscpdchat @tallerteacher @mathsjem

David Chart @tallerteacher · Nov 19

I'm not sure how comfortable I am with the concept of "dividing" vectors here. #mathscpdchat

Catherine van Saarloos @CoreMathsCat · Nov 19

Replying to @danicquinn

I like to just show diagram and ask them to tell me how to get from one point to another using \mathbf{a} and \mathbf{c} . Or just say "from this diagram what else do you know?" #mathscpdchat

Dani Quinn @danicquinn · Nov 19

So treating it as a goal-free problem? (@mrbartonmaths talks about them here - about halfway down: mrbartonmaths.com/teachers/resea...) #mathscpdchat How do you eventually move them to the tricky final leap?

Catherine van Saarloos @CoreMathsCat · Nov 19

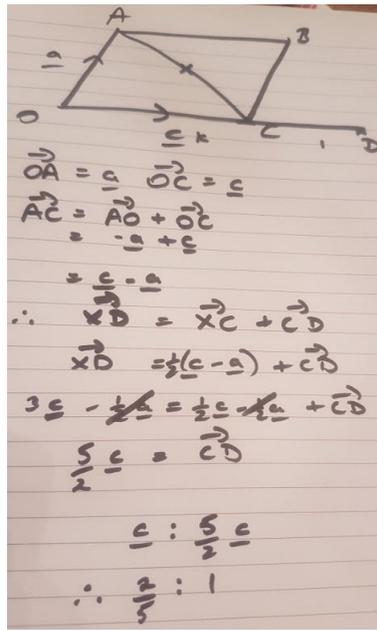

I would certainly be building up to this. In this one they should know how to get a form of \vec{XD} (mixture of \mathbf{c} , \mathbf{a} and CD) and they are given \vec{XD} so can compare. Very hard to explain in tweet sorry. I love goal free though because it enables students to access any qn (even just st)

Catherine van Saarloos @CoreMathsCat · Nov 19

Replying to @danicquinn

Sorry this is messy (big fat felt tip).

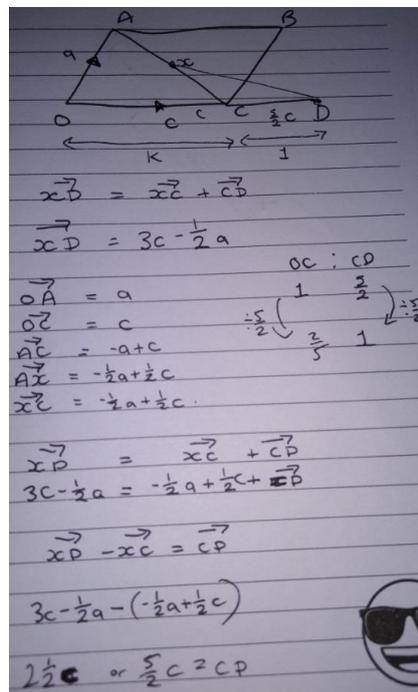

and these from [Kerry](#), [Dani Quinn](#), [Matt Lewis](#) and [Colin Hegarty](#):

kerry @kerryleicester · Nov 19

Replying to @danicquinn

I couldn't explain how I did it which is why I don't like teaching it!

Dani Quinn @danicquinn · Nov 19

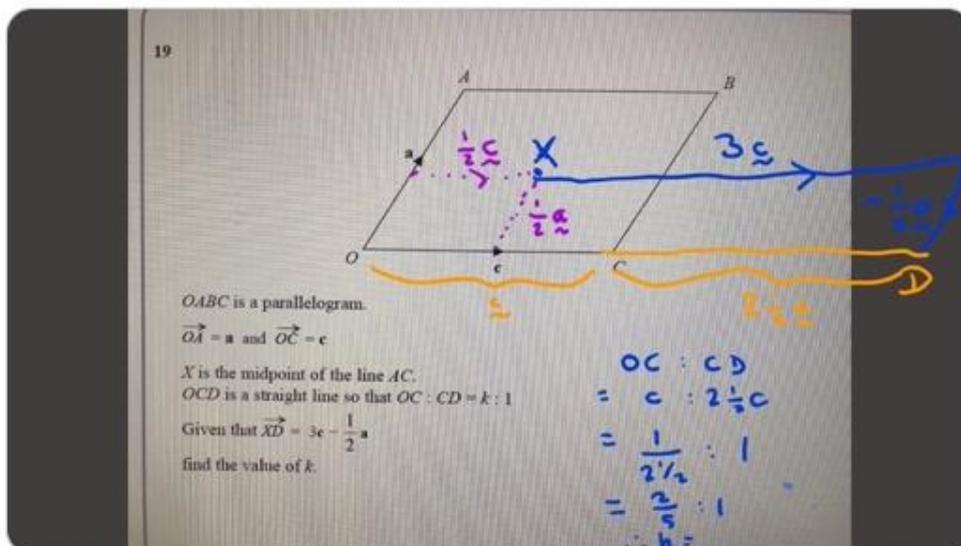

I FEEL THE SAME WAY! I can explain what I did, not how I knew to do it.

Matt Lewis @mattlewis73 · Nov 19

Replying to @danicquinn

As much geometry as possible, the tricky part is expressing 1:2.5 as k:1.

Colin Hegarty @hegartymaths · Nov 19

Oh, what a lovely method!

Among the links shared were:

[An Introduction to Vectors](#) which is an NRICH article (2011) by Toni Beardon that describes what vectors are and how to add, subtract and multiply them by scalars, and it gives some indications of why they are useful. It provides a summary of the elementary ideas about vectors that are usually met in school mathematics. It was shared by [Dani Quinn](#)

[Grid Moves](#) which are tasks by Don Steward designed to involve students in simplifying expressions although the letters are not used as variables, and they constitute a simple introduction to vectors used to find 'as the crow flies' direct journey lengths. It was shared by [Dani Quinn](#)

[Harder GCSE Vector Questions](#) which is material that includes tasks by Don Steward that require students to use vectors to prove results. It was shared by [Dani Quinn](#)

[Vector Geometry: Review question: Solution](#) which is material from *Underground Mathematics* that shows clearly a way of solving a vector problem. It was shared by [Dani Quinn](#)

[Equating Coefficients in Identities](#) which is 'practice material' designed for GCSE (AQA Higher). It was shared by [Dani Quinn](#)

[Equating Coefficients](#) which is more 'practice material' for students. It was shared by [Dani Quinn](#)

[Goal Free Problems](#) which is a place to find and share goal free problems. It was shared by [Dani Quinn](#)

[Shinglee Examination Questions](#) which are textbooks mentioned during the discussion. It was shared by [Lee Overy](#)

[Vectors: tasks](#) which is a collection of NRIC tasks involving vectors. It was shared by [Mary Pardoe](#)

[Secondary School Students' Difficulties With Vector Concepts](#) which is an article by Eleni Demetriadou and Constantinos Tzanakis. It was shared by [Mary Pardoe](#)

[Vectors and Geometry](#) which is practice material by [Mr Hodgson CMA](#). It was shared by [Mr Hodgson CMA](#)
